Bilingual (English/Spanish) | Authorized to work in the US | Austin, TX

Education

- B.S. in Computer Science, minor in Business from St. Edward's University in Austin, TX 2024

Work History

Front-End Software Engineer at Jeff Martin Auctioneers, TX

May 2024 - August 2026

- Owned the SDLC as the sole front-end engineer to replace a legacy ERP with a TypeScript/Next.js system on Docker, giving staff one intuitive system for daily operations.
- Engineered 170+ reusable React components with HTML, JavaScript, and Tailwind CSS and connected them to 8 back-end services through REST APIs designed with the back-end and DevOps engineers, so each page only fetched the needed data, optimizing loading speeds.
- Created a one-time passcode email login in Python with a React front-end, so users could sign in securely without a password.
- Built the front-end of a live auction display with WebSockets and the Dolby API, letting auctioneers and online bidders see item updates and the livestream in real time.
- Interviewed the CEO, CFO, and staff about pain points, designed the solutions in Figma, and turned them into Jira tickets, iterating over features with users across Agile Scrum sprints.
- Managed the team's code with Git, code reviews, and Prettier formatting, and wrote 50+ Vitest tests for core functions and components, keeping every release stable.
- Led 2 accessibility epics in Jira, using Claude to audit the app and fix WCAG 2.2 gaps.

Full-Stack Software Intern at Renzoe Box, TX

August 2022 - December 2022

- Developed React interfaces for a beauty-tech startup that scanned users' faces and recommended makeup, working alongside senior engineers in Python (Flask) and SQL.
- Configured an AWS cloud project from scratch with Amplify, S3, and Lambda.
- Implemented CRUD operations in a Flask and SQL backend.

Projects

Hunt Sync

- Ran a testing and security audit of a 152-endpoint REST API for a hunting-club SaaS built with Python (Django) and PostgreSQL, discovering high-risk bugs in 19 of them.
- Designed an AI-assisted testing project with Claude, scaling the pytest suite by 500+ tests.
- Maintained live bug tracker documentation to brief the founding engineers weekly.

Autonomous Vehicle Delivery Service

- Collaborated cross-functionally in a team of 7 for a simulation where self-driving cars delivered vaccines to a hospital, tracking deliveries on a live map powered by Mapbox.
- Used Python multithreading to run many vehicles at once and AJAX to refresh data, so both supply and demand sides could track orders in real time.
- Rotated through front-end, back-end, QA, and DevOps roles across 8 sprints, shipping updates with CI/CD in Bitbucket Pipelines and demonstrating it at the final demo.
