Bilingual Full-Stack Software Engineer | B.S. in Computer Science

Capabilities Summary

- *Front-End Engineering:* React, TypeScript, Next.js, and Tailwind CSS, building reusable component libraries, real-time WebSocket interfaces, and WCAG 2.2 accessible UIs.
- *Back-End and API Development:* Python (Django, Flask), REST API design across microservices, PostgreSQL and MySQL, and integrating third-party and GraphQL APIs.
- *DevOps and Cloud:* Running multi-repository Docker environments, automating deployments with CI/CD, and configuring AWS projects.
- *Quality Assurance:* Vitest and pytest suites, AI-assisted API security auditing, code reviews, and WAVE accessibility testing.
- *Product and Collaboration:* Turning executive and user pain points into designs, tickets, and shipped features. Bilingual in English and Spanish.

Experience

Front-End Software Engineer at Jeff Martin Auctioneers, TX

May 2024 - August 2026

- Owned the SDLC as the sole front-end engineer, replacing a legacy ERP with a TypeScript/Next.js system on Docker that gave staff one intuitive system for daily operations.
- Defined REST APIs and data shapes with back-end and DevOps teams to connect 8 microservices to 170+ reusable React components built with JavaScript, HTML, and Tailwind CSS, ensuring each page fetched only the data it needed and loaded faster.
- Created a forgot-password flow with a Python emailing service and a React front end, sending one-time passcodes so users could sign in securely.
- Trained the team's AI/ML developer in 5 sessions on the style guide I wrote, Figma designs, and my reusable component library, keeping the UI/UX consistent across web and mobile.
- Built the front-end of a live auction display with WebSockets and the Dolby API for auctioneers and online bidders to see item updates and the livestream in real time.
- Interviewed the CEO, CFO, and staff about pain points, designed solutions in Figma, and turned them into Jira tickets, iterating with users across Agile Scrum sprints.
- Led 2 accessibility epics to fix WCAG 2.2 gaps found with WAVE and Claude, and wrote 50+ Vitest tests to keep every release stable.
- Streamlined the team's daily setup with a Bash script that pulled every repository and started them all in Docker at once, cutting startup from 10 to 5 minutes.

Web Development Intern at Cooledtured, TX

November 2023 - March 2024

- Refactored an online store's front end with React and TypeScript on Shopify Hydrogen that ingested a GraphQL API.
- Resolved all 9 tickets and reviewed code in 15 pull requests to keep the codebase clean.

- Developed React interfaces for a beauty-tech startup, working with senior engineers to implement CRUD operations in a Python (Flask) and SQL backend.
- Slashed post-release defects by 50% through linting and Git code reviews, presented 8 sprint demos, and met 100% of sprint deadlines.
- Configured an AWS cloud project from scratch with Amplify, S3, and Lambda.

Projects

WeGo

- Collaborated cross-functionally on a simulation where self-driving cars delivered vaccines to a hospital, tracking deliveries on a live Mapbox map.
- Used Python multithreading to run many vehicles at once and AJAX to refresh data, so both supply and demand sides could track orders in real time.
- Helped a 7-person team evolve from Trello confusion, thin documentation, and merge conflicts into a self-sufficient Scrum team through daily standups and weekly syncs.
- Rotated through front-end, back-end, QA, and DevOps roles across 8 sprints, coaching each incoming teammate and presenting a final demo to industry stakeholders.

Hunt Sync

- Ran a testing and security audit of a 152-endpoint REST API for a hunting-club SaaS built with Python (Django) and PostgreSQL, discovering high-risk bugs in 19 of them.
- Executed an AI-assisted testing project with Claude, scaling the pytest suite by 500+ tests.
- Kept a bug tracker with root causes and suggested fixes to brief the founding engineer.

HoopLogic

- Designed a full-stack NBA stats app with React, Python (Flask), and MySQL, allowing prop bettors to compare stats ingested from the NBA API in interactive D3.js charts and tables.
- Automated weekly updates to a MySQL database of 90k+ stat lines through Bitbucket CI/CD.

Education & Certificates

- B.S. in Computer Science, minor in Business from St. Edward's University, Austin, TX 2024
- Intensive Cloud Computing Hands-On Training (The Cloud Bootcamp)
- AWS Essential Training for Developers (LinkedIn)
