Bilingual (English/Spanish) Authorized to work in the US | Austin, TX

Education & Certificates

- B.S. in Computer Science, minor in Business from St. Edward's University in Austin, TX 2024

Work History

Front-End Software Engineer at Jeff Martin Auctioneers, MS

May 2024 - August 2026

- Led the SDLC to replace a legacy ERP with a modern TypeScript/Next.js system running on Docker, resulting in a single intuitive system for staff of all technical levels to manage day-to-day operations.
- Engineered 170+ reusable React components with HTML, JavaScript, and Tailwind CSS and connected them to the company's microservices through REST APIs, working with the back-end and DevOps engineers on API design so every page fetched optimized data.
- Collaborated cross-functionally with the CEO, CFO, and staff in an Agile Scrum team by gathering their pain points and turning them into Figma designs and Jira tickets, solving real problems each sprint.
- Used AI tools (Claude) to audit and fix accessibility gaps against WCAG 2.2 guidelines.
- Managed the team's code with Git, code reviews, and Prettier formatting, and wrote 50+ Vitest tests for core functions and components, keeping every release stable.

Full-Stack Software Intern at Renzoe Box, TX

August 2022 - December 2022

- Worked on Trello tickets given by senior engineers for React interfaces, resulting in the creation of a web app for a beauty-tech startup that scans faces and recommends makeup.
- Configured an AWS cloud project from scratch with Amplify, S3, and Lambda.
- Implemented CRUD operations in a Flask and SQL backend.

Projects

Hunt Sync

- Ran a security audit of the REST API for a SaaS built with Django (Python) and PostgreSQL.
- Designed an AI-assisted testing project with Claude, scaling the pytest suite by 500+ tests that discovered defects in 45% of the endpoints, including payment and safety features.
- Wrote a live documentation file used to update the founding engineers weekly.

Autonomous Vehicle Delivery Service

- Built a simulation in a team of 6 where self-driving cars delivered vaccines to a hospital, and users ordered and tracked deliveries on a live map powered by Mapbox.
- Used Python multithreading to run many vehicles at once and AJAX to refresh data, so both supply and demand sides could track orders in real time.
- Rotated through front-end, back-end, QA, and DevOps roles across 8 sprints, shipping updates with CI/CD in Bitbucket Pipelines and demonstrating it at the final demo.
